POP FINANCE PROJECT
POPX TOKEN

As we know, traditional centralized financial systems exclude users, despite being the pillar of these systems, from any participation and therefore from any economic benefit.
At the end of the day, it is clear that these are systems that take away wealth from communities to centralize it in the hands of a few.
Thanks to the blockchain this has changed.
Today decentralized cryptocurrency systems are popular all over the world and allow anyone to participate and share the collected value.
Latest generation tokens that allow staking activities represent a further step forward in sharing the benefits of decentralized financial systems among users.
Communities are now able to generate wealth instead of just moving it.
Pop Finance's goal is to take another step, based on the sustainability of the staking process so as to preserve the value generated and offer users who support the token concrete wealth.

OPERATION

Pop Finance lives in the Binance Smart Chain and is based on the POPX token.
The best choice for a token whose goal is to be tested, popular, fast and cheap.
POPX respond to the BEP-20 standard therefore totally compatible with BSC wallets and BSC first swap platforms.
The initial quantity of POPX tokens is equivalent to 1 billion POPX, entirely distributed through public ICO.
At any time, a Pop Finance account holder with at least 0.0000000000000001 POPX who does not already have a stake can freeze the amount currently in the account for 15, 30, 60 or 90 days in exchange for interest calculated on the spot. based on the chosen expiration date and the total number of existing POPXs.
The dynamism of the interest paid was designed to discourage the stake process when the total tokens were too many.
Once the staking procedure has been started and approved by the system, your balance will be transferred to the jar pool and will only be unlocked at the end of the chosen period.
The corresponding interest will be credited immediately to the account, which is immediately transferable without any limitation.
The sum of all tokens present at a given time in all POPX accounts represents the circulating supply, while the sum of all tokens present in the Pool Jar at a given time represents the staked supply.
The sum of circulating and staking supply represents the totalSupply that is the total number of POPX tokens existing at that moment.
The POPX transfer takes place with the classic bep20 methods (including the delegate) except that, in the event of total existing POPX quantities greater than the initial distributed quantity, the transfer burns a fee equal to 1% of the transferred value.
This solid self-combustion system combined with the dynamic calculation of interest, the separate structure of balance sheets and pool jars, the characteristic of immediate spending of interest and the irrevocability of the staking status has been studied and tested to make the quantity of circulating tokens tend to a a figure that is always less than the number of tokens initially distributed.
The result is an autonomous financial system, backed by a community capable of generating wealth and self-financing.

TECHNICAL FEATURES

blockchain: BINANCE SMART CHAIN (BNB)
smart contract hash: 0x66eF7b84879e001f081A8Cf12D13e0188bE736a2
deployer hash: 0x193F6d3655ebde3004206a480bCce5C476F0a025
token type: BEP20
symbol: POPX
initial quantity: 1 billion POPX
official wallet: METAMASK
